AVANT-PROPOS

Generalites

L'annuaire du 1990 contient les résultats de l'enregistrement de certains éléments de l'électricité atmosphérique, des mesures diurnes (de 24 h) de nombre des noyaux de condensation et les plus principaux facteurs météorologiques effectuées à l'Observatoire Géophysique Stanisław Kalinowski, à Świder, qui fait partie de l'Institut Géophysique de l'Académie Polonaise des Sciences à Varsovie. Les données précédentes se rapportant aux années 1957-1965 ont été publiées dans des *Travaux de l'Observatoire Géophysique de Stanisław Kalinowski à Świder* et ceux qui se rapportant aux années 1966-1989 dans des *Publications de l'Institut Géophysique de l'Académie Polonaise des Sciences*.

Situation de la station

Świder est situé à une distance de 25 km environ au SSE de Varsovie et à une distance de 2,5 km environ de petite ville Otwock, qui est le centre d'administration et d'économie, ainsi que la station climatique. Aux alentours attenants on ne rencontre pas d'entreprises industrielles plus importantes. Świder est caractérisé par son image du parc et des villas à ses environs. Le terrain de l'Observatoire entouré d'une clôture à une superficie de 7 ha couvert d'arbres de pins et garnis de feuilles comport plusieurs clairières à l'intérieur. Sur une d'elles à une superficie de 1 ha environ est situé une station d'électricité atmosphérique et météorologique. À côté de la station, à l'extérieur de son terrain et de sa part SSW dépasse la ruelle Brzozowa à trafic local très faible. Au bord de la clairière se trouvent deux bâtiments de l'observatoire. L'un d'eux est un bâtiment d'administration, deuxième - un pavillon de mesures de la station.

Équipement en dispositifs de la station et son installation

L'installation de mesure et de l'enregistrement d'électricité atmosphérique est située surtout au pavillon et partiellement sur la clairière, ainsi que les postes d'observation météorologiques, qui se trouvent dans un abri météorologique et au jardin météorologique.

L'intensité du champ électrique est enregistré par deux circuits électroniques, qui sont identiques. Ils fonctionnent indépendamment l'un à l'autre sur deux gammes de mesures différentes (+960 V/m et +2800 V/m). L'un d'eux est implanté au milieu de la clairière et l'autre juste à côté du pavillon de mesures. Chaque circuit de mesure comprend une sonde radioactive (activité de 30 μ C environ), fixée sur une tige métallique placée à l'intérieur de l'isolateur, ainsi qu'un électromètre vibratoire (Fig.1). Pour la protection contre les ef-

Fig.1. Schéma - bloc du système d'enregistrement de l'intensité du champ électrique; K - collecteur radioactif, ED - électromètre vibratoire, R - milliampéromètre enregistreur.

Block diagram of the set recording the electric field strength; K - radioactive collector, ED - vibron electrometer, R - recording milliamperometer.

fets nuisibles des agents atmosphériques, les électromètres sont placées dans les boîtes métalliques. Supplémentairement elles sont réchauffées pour une bonne maintenance de grande résistance des isolateurs. Chaque boîte avec les électromètres est fixée sur une tube métallique. La sonde du circuit, qui se trouve au milieu de la clairière à une hauteur de 200 cm au-dessus de la surface du sol et celle du circuit de côté du pavillon - 230 cm.

Les différences du potentiel électrique, qui se produit entre les sondes et la surface du sol, amplifiées par les électromètres, sont transmises par l'intermédiaire des câbles souterrains aux milliampéromètres-enregistreurs, installés au pavillon. Tous les deux circuits de mesure, construits à l'Observatoire, se caractérisent par une très grande résistance d'entrée dépassante 10^{14} Ohms en comparaison à celle de sonde (7×10^{10} Ohms environ), ce qui permet en effet d'une raison importante d'éliminer l'influence du vent sur la mesure de l'intensité du champ électrique. En outre, ils se caractérisent d'une très

bonne stabilité d'indication du zéro, la valeur constante de l'amplification, ainsi qu'une dépendance linéaire de l'indication en fonction de la valeur d'intensité de champ. La constante du temps pour chaque circuit est égale à 7 s.

L'installation destinée à l'enregistrement de la conductibilité électrique de l'air à polarisation positive comprend un condensateur à l'aspiration Gerdien avec une batterie d'éléments électriques, un électromètre vibratoire et milliampéromètre-enregistreur (Fig. 2). Le condensateur à l'aspiration est

Fig. 2. Schéma - bloc du système d'enregistrement électrique de la conductibilité de l'air; KG - condensateur à l'aspiration Gerdien, B - batterie d'éléments électriques, ED - électromètre vibratoire, R - milliampéromètre enregistreur.

Block diagram of the set recording the electric conductivity of the air; KG - Gerdien's aspiration condenser, B - battery of electric cells, ED - vibron electrometer, R - recording milliamperometer.

installé dans une cabine en maçonnerie séparée, située sur la clairière à une distance de 3 m du pavillon de mesure. L'aspiration de l'air contrôlé est exécutée à une hauteur de 1 m au-dessus de la surface du sol. L'électromètre vibratoire est installé au pavillon de mesure et il est connecté au condensateur à aspiration par l'intermédiaire d'un câble concentrique souterrain de grande résistance. La mobilité limite de ce condensateur s'élève à $2,6 \text{ cm}^2/\text{V}\cdot\text{s}$. La constante de temps du circuit de mesure s'élève à 60 s.

La densité des noyaux de condensation est mesurée trois fois toutes les 24 heures aux intervalles de temps suivants: I. $6^{\text{h}}10^{\text{m}}-6^{\text{h}}30^{\text{m}}$; II. $11^{\text{h}}00^{\text{m}}-11^{\text{h}}30^{\text{m}}$; III. $18^{\text{h}}10^{\text{m}}-18^{\text{h}}30^{\text{m}}$ (TMGr), à l'aide du compteur photoélectrique des noyaux de condensation. Le compteur se trouve à l'intérieur du pavillon, mais les échantillons de l'air contrôlé sont prélevés de l'extérieur du bâtiment, à une hauteur de 1 m au-dessus de la surface du sol. L'aspiration de l'air est exécutée à l'aide d'une pompe de rotation, par l'intermédiaire du tube en caoutchouc de longueur de 1 m.

Les principaux éléments météorologiques, telles que la température de l'air, la tension de la vapeur de l'eau et l'humidité relative, sont mesurés dans un abri météorologique (à une hauteur de 2 m au-dessus de la surface du sol) situé à une distance de 25 m environ de rebord de la clairière de mesure. La pression atmosphérique est déchiffrée à l'aide du baromètre de station à mercure situé dans le bâtiment de l'Observatoire. La vitesse et la direction du vent sont déterminées d'après les indications de l'anémographe Fuess. Son

palpeur de mesure est installé sur une tige métallique à une hauteur de 17 m. La grandeur de précipitation atmosphérique est mesurée à l'aide du pluviomètre Hellmann, dont la surface active est égale à 200 cm². Les autres phénomènes météorologiques sont notés sur la base des observations visuelles effectués sur la clairière de mesure et sur la toit du bâtiment d'administration.

Tableaux des mesures et de l'enregistrement

Dans les tableaux mensuels on a établi les valeurs moyennes horaires du champ électrique (d'après TMGr), prenant en considération le coefficient de réduction concernant la surface plat. Les données peu sûres sont placées entre parenthèses; par contre, les moyennes se rapportant à une période de moins d'une heure (mais pas inférieures à 40 min.) sont enfermées dans les crochets. L'intensité du champ, dont les valeurs ont dépassées partiellement hors de la gamme de mesure dans la direction de valeurs positives où négatives on a précédé du signe > où <. Dans les cas, où pour le secteur horaire donnée les valeurs de cet élément ont dépassées partiellement hors de la gamme de mesure dans tous les deux directions on a signé par un symbole $\uparrow$ ou $\downarrow$. Dans la partie inférieure des tableaux on a établi les valeurs moyennes mensuelles, déterminées sur la base des heures respectives du jour pour les périodes de "beau temps" - A et pour toutes les heures sans exception N. Dans la partie droite de ces rubriques on a mis aussi les moyennes mensuelles totales A et N. Chaque jour on a présenté aussi les moyennes diurnes de valeur du champ électrique A et N, les maxima diurnes (Max.), les minima (Min.), les amplitudes (Ampl.), ainsi que le caractère du temps présenté par symboles internationaux (page 11). Les valeurs moyennes horaires du champ électrique ont été soulignées d'un trait continu en cas, où en ce temps-la il y avait une précipitation atmosphérique (pluie, bruine, neige, grêle), brume, orage local où lointain, une nébulosité de l'étage inférieur plus que 3/10 de la couverture de ciel, le vent à vitesse plus que 6 m/s où le champ électrique était négative où avait dépassé 1000 V/m. Pour les calculs des valeurs horaires moyennes insérés à la rubrique A, c'est à dire pour les périodes du beau temps, on a pris des données non soulignées et sans paranthèses (données peu sûres).

Les tableaux mensuels de la conductibilité de l'air à polarité positive comprennent: les valeurs moyennes horaires (d'après TMGr), les moyennes diurnes, les maxima diurnes, les minima, les amplitudes, la caractéristique du temps, ainsi que les moyennes mensuelles pour les heures respectives et les moyennes mensuelles complètes. Dans ces tableaux on a pris en considération de la même façon, que pour le champ électrique, les moyennes des jours normaux A et les moyennes calculées pour toutes les heures sans exception N.

Le nombre de noyaux de condensation par 1 cm³ d'air on a établi sur la base de trois mesures effectuées à des heures différentes de la journée (I, II, III). Sur la base de ces données on a calculé les moyennes diurnes et les moyennes mensuelles M.

Dans les tableaux englobants les éléments météorologiques on a mis les valeurs de la pression atmosphérique, de la tension de la vapeur d'eau, de la direction et de vitesse du vent, du degré et du type de nébulosité mesurés trois fois par 24 heures (à 6^h, 12^h, 18^h TMGr). A partir du 1 janvier 1989 le degré de nébulosité on a présenté à l'échelle du 0 à 8. Les valeurs de la température d'air et de l'humidité relative ont été par contre mesurées quatre fois par 24 heures (à 0^h, 6^h, 12^h, 18^h MTGr). On a noté aussi les valeurs diurnes de la température d'air maximum (Max.), minimum (Min.) et de son amplitude (Ampl.), ainsi que des températures minimum audessus de la surface du sol (+5 cm, Min.). Hors de ces données on a établi de la somme des précipitations atmosphériques, de l'épaisseur de la couche de neige et sous la rubrique "Remarques" - les heures d'exposition et la degré d'intensité des autres phénomènes météorologiques (d'après TMGr). Ces dernières phénomènes on a établi sous une forme des symboles météorologiques internationaux. Les moyennes diurnes M des valeurs des éléments météorologiques on a calculé sur la base de trois où quatre mesures effectués par 24 heures et les moyennes mensuelles M de toutes les mesures périodiques.

En 1990 les mesures de l'électricité atmosphérique et des éléments météorologiques ont été réalisées par: S. Warzecha, W. Kozłowski, D. Jasinkiewicz, E. Chmurzyńska et G. Szubska. Toutes les personnes susmentionnées ont pris part à l'élaboration des matériaux. L'impression des matériaux a été préparée par S. Warzecha. La coordination de l'ensemble des travaux a été assurée par le chef du Laboratoire de l'Électricité Atmosphérique de l'Institut de Géophysique à Varsovie, S. Michnowski.

INTRODUCTION

General information

The present issue contains the results of recordings of some elements of atmospheric electricity and daily observations of major meteorological factors noted at the St. Kalinowski Geophysical Observatory of the Polish Academy of

Sciences at Swider in 1990. Data for the years 1957-1965 have been published in *Prace Obserwatorium Geofizycznego im. St. Kalinowskiego w Świdrze* and for 1966-1989 in *Publications of the Institute of Geophysics, Polish Academy of Sciences*.

Location of the station

Swider is located approximately 25 km SSE of Warsaw and 2.5 km NNW of town Otwock - a small resort and local administrative center. There is no major industry and villa-type housing prevails in the area. Bounded premises of the Observatory, some 7 ha in area, is overgrown by pine and deciduous trees with a few clearings. One of these, approximately 1 ha in area, is the site of the atmospheric electricity and meteorological station. A small street Brzozowa, with a little local traffic, is situated nearby the premises, in the SSW direction. Two observatory buildings are located at the edge of the clearing: the administrative building and the measurement pavilion of the station.

The instruments and their location

The measuring and recording instruments of atmospheric electricity are mainly located in the pavilion and partly on the clearing, while the meteorological observations are performed in meteorological shelter and meteorological garden.

The electric field intensity is recorded by two identical electronic sets. They operate independently of each other on two ranges (960 V/m and 2800 V/m). One set is located in the center of the clearing, the other nearby the measurement pavilion. Each set consists of a radioactive collector (activity of about 30 μC), placed on a metal rod seated in an insulator, and a special dynamic electrometer (Fig. 1). The electrometers are inside separate metal casings, to protect them from harmful weather influences. They are additionally heated to sustain the high resistivity of insulators. Each case with the electrometer is mounted on a metal pipe. The height of the collector above the ground is 200 cm for the set in the center of the clearing and 230 cm for the other one.

The differences in electric potential occurring between the collectors and the Earth's surface, amplified by electrometers, are transmitted through buried cables to recording milliammeters installed in the pavilion. Both measuring sets have been constructed in the Observatory and are characterized by very high input resistance ($<10^{14} \Omega$) as compared to the so-called collector resistance (about $7 \times 10^{10} \Omega$), which largely eliminated the effect of wind on the electric field recording. They also have a very good stability of zero,

constant value of amplification, and linear dependence of indications on the electric field intensity. The time constant of each set is 7 s.

The arrangement for recording the electric conductivity of positive polarity consists of Gerdien's aspiration condenser with electric batteries, dynamic electrometer and recording milliamperometer (Fig. 2). The aspiration condenser is within a separate brick hut located at the clearing, some 3 m away of the measurement pavilion. The air is aspirated 1 m above the Earth's surface. The dynamic electrometer is placed in the measurement pavilion and is connected with the aspiration condenser by means of a buried high-resistance screened cable. The boundary mobility of the condenser is 2.6 cm/Vs. The time constant of the whole arrangement is 60 s.

The condensation nuclei content in the air has been measured with a photoelectric condensation nuclei counter three times daily: 6^h10^m-6^h30^m GMT (I), 11^h00^m-11^h30^m GMT (II), and 18^h10^m-18^h30^m GMT (III). The counter is placed inside the pavilion, while the air samples are collected from outside of the building, at a height of 1 m above the ground. The aspiration of air is made by an electric rotational pump through a 1 m long rubber pipe.

Basic meteorological elements, such as air temperature, water vapour pressure and relative humidity of the air are measured in a meteorological shelter 2 m above ground; the shelter is situated about 25 m from the clearing's edge. The atmospheric pressure is read out from the station mercury barometer within the administration building of the Observatory. The velocity and direction of wind are read out from indications of an anemograph manufactured by Fuess. Its sensor is installed on a metal mast at a height of 17 m. The amount of atmospheric precipitation is measured by Hellman's rain-gauge, with an intercepting surface of 200 cm. Other meteorological phenomena are observed visually from the clearing and a roof of administrative building.

Tables

The monthly tables of the electric field contain hourly means (according to GMT) taking into account the reduction coefficient to a flat surface. Uncertain data are placed in round brackets, while the mean values calculated for part of an hour (at least 40 minutes) are in square brackets. If the field values exceeded the measurement range in the positive or negative direction, the mean value is preceded by sign > or <, respectively. If the values exceeded the range in both directions through the same hour, the mean values are marked with the sign $\updownarrow$. Mean monthly values calculated for every hour for the so-called fair-weather periods A and for all data N are listed at the bottom of the tables. For each day there are also listed the following: daily values

of the electric field (*A* and *N*), daily maxima (Max.), minima (Min.), amplitudes (Ampl.), and type of weather (symbols explained on page 11). The hourly means of the electric field are underlined with a solid line if during the given hour there occurred: rain, drizzle, snow, hail, fog, local or distant thunderstorm, lower cloudiness exceeding 1/3, wind velocity exceeding 6 m/s, the field value was negative or exceeded 1000 V/m. The hourly mean values in column A, i.e., for fair-weather periods, were calculated for data which were neither underlined nor marked with round brackets.

The monthly tables of electric conductivity of positive polarity contain: hourly means (in GMT), daily means, daily maxima, minima and amplitudes, weather type, monthly means for every hour and total monthly means. Like in the case of the electric field, the means were calculated for the fair-weather periods *A* and for all hours with no exception *N*.

The condensation nuclei content data are given for three measurement terms daily (I, II, and III). The daily means and monthly means *M* were calculated on the basis of these data.

The meteorological tables contain the following elements (6^h00^m, 12^h00^m, 18^h00^m GMT) measured three times a day atmospheric pressure, water vapour pressure, direction and velocity of wind, cloudiness and type of clouds. Since January 1989 the cloudiness has been measured in the scale 0 to 8. The values of our temperature and relative humidity refer to four measurement terms daily (0^h00^m, 6^h00^m, 12^h00^m, 18^h00^m GMT). The tables contain also the highest (Max.) and lowest (Min.) temperatures and the temperature amplitude (Ampl.) and lowest temperatures at ground surface (+5cm, Min.) during the day as well as the sum of atmospheric precipitation and snow cover height. The column headed "Remarks" lists the timing (in GMT) and intensity of other meteorological phenomena; the international meteorological symbols are used. The daily means *M* of meteorological elements were calculated from three or four values daily, and the monthly means *M* from all values at observation terms.

In 1990, atmospheric electricity and meteorological observations, as well as the data treatment, were carried out by S. Warzecha, W. Kozłowski, D. Jaskiewicz, E. Chmurzyńska, and G. Szubska. The material was prepared for publication by S. Warzecha. The project was supervised by the head of the Atmospheric Electricity Laboratory of the Institute of Geophysics, S. Michnowski.

TABLE DE MATIERES - CONTENTS

Avant-propos - <i>Introduction</i>	3
Champ électrique atmosphérique - <i>Electric field strength</i>	14
Conductibilité d'air - <i>Air conductivity</i>	26
Nombre de noyaux de condensation - <i>Number of condensation nuclei</i> ...	38
Les éléments météorologiques - <i>Meteorological elements</i>	44

ISSUES TO BE PUBLISHED IN 1992

		<u>price</u>
M-16 (245)	Selected Geophysical Problems in Mines, Lubiatów, 13-18 May 1991	USD 20
F-18 (248)	Earth Tides, Marées Terrestres 1988/1989	USD 10
C-45 (250)	Results of Geomagnetic Observations, Belsk 1991	USD 7
C-46 (251)	Results of Geomagnetic Observations, Hel Geophysical Observatory, 1991	USD 7
D-38 (252)	Atmospheric Ozone, Solar Radiation 1991	USD 8
D-39 (253)	Électricité Atmosphérique et Météorologie Observatoire Géophysique de S.Kalinowski à Świder 1991	USD 8
C-47 (254)	Results of Geomagnetic Observations, Polish Polar Station Hornsund, Spitsbergen, 1986-1987	USD 8
A-20 (255)	Proceedings of the International Conference EUROPROBE - FIRST STUDY CENTER held in Jabłonna on Sept 26 - Oct 3, 1991	USD 15
C-48 (256)	Results of Geomagnetic Observations, Polish Antarctic Station Arctowski, King George Island 1986-1987	USD 8

PUBLICATIONS OF THE INSTITUTE OF GEOPHYSICS POLISH ACADEMY OF SCIENCES

D. ATMOSPHERE PHYSICS

List of our publications since 1983 devoted to the atmosphere physics; the full list is published on the cover of our former issues.

- D - 16 (158) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1981.
- D - 17 (168) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1982.
- D - 18 (169) Atmospheric ozone 1982 and 1963-1981. Solar radiation 1982.
- D - 19 (177) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1983.
- D - 20 (178) Atmospheric ozone, solar radiation 1983.
- D - 21 (183) Borkowski J., The structure of turbulence in the surface layer of the atmosphere.
- D - 22 (189) Atmospheric ozone, solar radiation 1984.
- D - 23 (190) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1984.
- D - 24 (194) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1985.
- D - 25 (197) Atmospheric ozone, solar radiation 1985.
- D - 26 (198) Papers on atmospheric electricity.
- D - 27 (209) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1986.
- D - 28 (211) Atmospheric ozone, solar radiation 1986.
- D - 29 (219) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1987.
- D - 30 (220) Atmospheric ozone, solar radiation 1987, Umkehr ozone profiles, Belsk 1963-1981.
- D - 31 (229) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1988.
- D - 32 (230) Atmospheric ozone, solar radiation 1988.
- D - 33 (233) Atmospheric ozone, solar radiation 1989.
- D - 34 (234) Électricité atmosphérique et météorologie Observatoire Géophysique de St. Kalinowski a Świder 1989.
- D - 35 (238) Proceedings of the International Workshop on Global Atmospheric Electricity Measurements, Małdralin, Poland, 10-16 September, 1989.
- D - 36 (246) Atmospheric ozone, solar radiation 1990.
